3028

Paper Title

AI Powered Legal Assitant

Abstract

The Indian legal system faces significant challenges, including delayed case resolutions, lack of accessible legal information, and a shortage of affordable legal guidance. To address these issues, this project introduces an AI-Powered Legal Assistant, a web-based solution that leverages Natural Language Processing (NLP) and machine learning to simplify legal interactions. Developed using Django, the system features an AI chatbot trained on Indian law documents to answer user queries, a legal document repository for direct access to acts and regulations, and a lawyer recommendation system that filters lawyers based on location and case type. Users can submit a contact form and receive lawyer details via email, bridging the gap between legal needs and professional support. The platform enhances legal awareness, reduces research time, and improves access to justice through an intuitive and scalable interface.
